Fast ai lesson 5 chapter 3 data ethics

05 July 2021   12:41

- Applied ethics
  Many problems can happen if we
  don't follow ethics

  Resource and accountability :
  Common issue the system
  implemented with no way to
  identify & address mistakes

  When the technologies built in
  the different side of world cannot
  be implemented to the different
  country

  So all in the sense that since the data
  we are passing is kind of biased cause
  humans are kind of biased in nature
  it's there since historically we can't
  really do anything regarding it

  Since the machine learning is already
  amplifying what it already is and kind
  of aiming what the data is gonna be in
  future

  So the summary of this lesson is this
  that the research which we are going
  to do can be used in really harmfull as
  well as really useful way so before
  doing the research we should ask that
  research really worth it cause some
  times the race recognition is used in
  china to detect urugwe chinease and
  they were opressing them basis on
  their race this is the wrong use of
  research

  Same as it shows that we should not
  be doing something which does not fit

in our ethics
